Jayanth Peddi

Hyderabad, India jayanthpeddi999@gmail.com
in/jayanth-peddi github.com/jp-999

Professional Summary

AI and Quality Operations professional with experience in GenAI training, RLHF, SFT, and AI code evaluation. Skilled in KPI monitoring, quality management, contributor leadership, and workflow optimisation, with a strong focus on improving LLM performance, maintaining quality standards, and scaling project operations.

Education

B.Tech, Computer Science & Engineering *11/2021 - 04/2025*
CMR Engineering College *Hyderabad*
MPC Intermediate – 86% *06/2019 - 04/2021*
Narayana Junior College *Hyderabad*

Work History

GenAI Queue Manager *04/2026 - Present*
Sacle AI
- Selected for project leadership, helping scale a GenAI Coding project from fewer than 20 to 300+ contributors, achieving 15×+ growth.
- Led quality and delivery operations, overseeing KPI monitoring, performance tracking, calibration, and escalation resolution across GenAI coding workflows.
- Developed KPI tracking systems, centralised documentation (SSOT), and contributor training resources to standardise quality expectations and improve operational consistency.

AI Trainer *04/2025 - 04/2026*
Outlier
- Enhanced top-tier global LLM capabilities by applying fine-tuning techniques including RLHF and SFT to improve model accuracy and alignment.
- Tested multimodal AI code generation using front-end frameworks including Next.js, React, Vue.js, and HTML/CSS/JS to produce production-ready frontends.
- Contributed across diverse project types including UI, RLHF, STEM, Generalist, and Coding as a trusted platform contributor.

Backend Developer *12/2024 - 03/2025*
IIIION
- Built high-performing server-side applications using external APIs, MongoDB for robust data operations, and Next.js for streamlined workflows.
- Delivered flexible and engaging digital products with a strong focus on performance and responsiveness.
- Strengthened backend functionality by integrating external APIs and MongoDB data operations, ensuring reliable data handling and seamless application workflows.

Full Stack Developer *04/2024 - 09/2024*
NEXZAP
- Delivered scalable front-to-back solutions by crafting reusable UI components and integrating them smoothly with REST APIs.
- Contributed to project planning and development strategy, ensuring each sprint aligned with the broader product vision.
- Built and refined reusable React components and REST API integrations, improving code modularity and supporting maintainable, scalable application development.

Projects

Food Ordering App (Little Lemon)
- Leveraged React Native to design an intuitive onboarding flow and smooth navigation for improved user experience.
- Developed a user-centric interface allowing for fast and efficient food selection and checkout.

Attendance Management
- **Implemented Face Recognition for Attendance:** Developed a smart system using facial recognition to automate and authenticate user check-ins.
- **Boosted Operational Productivity:** Reduced manual tasks, cutting down errors and saving time for administrative teams.

Skills

Quality Management & Operations: Quality Assurance, KPI Tracking, Performance Monitoring, Quality Evaluation, Calibration, Escalation Management, Quality Standards, Process Improvement, SSOT Documentation

Leadership & Project Management: Project Leadership, Contributor Management, Team Coordination, Cross-Functional Collaboration, Stakeholder Communication, Project Delivery, Onboarding, Training Development

AI Training & Evaluation: Large Language Models (LLMs), RLHF, SFT, Fine-Tuning Techniques, AI Model Evaluation, Multimodal AI Code Generation, Coding Evaluation, AI Training Workflows

Languages & Web Technologies: HTML, CSS, JavaScript (JS)

Frontend: Next.js, React.js, Vue.js, UI Components, User Experience, Responsive Web Design

Backend & APIs: Node.js, Server-Side Applications, API Design, External APIs, REST APIs, Third-Party Integrations

Databases: MongoDB

Machine Learning & Research: Machine Learning, Face Recognition, K-Nearest Neighbors (KNN), Graph Neural Networks (GNN), Software Fault Localization

Development & Product Practices: Scalable Web Applications, Requirements Translation, Reusable UI Components, Project Planning, Development Strategy, Sprint Alignment, Performance and Responsiveness

Mobile Development: React Native

Certifications

- **Meta React Native Specialization – Coursera**
  Learned cross-platform mobile development, React Native, JavaScript, UI/UX design, API integration, and version control.
- **Full Stack Web Development – Udemy**
  Developed knowledge of frontend and backend technologies, web application development, API integration, and database management.
- **Data Structures & Algorithms I – edX**
  Studied arrays, linked lists, stacks, queues, recursion, and algorithmic time complexity.
- **Make Your Own App – edX**
  Explored mobile application development concepts, app design, and the process of building functional applications.
- **Machine Learning – Stanford University**
  Studied machine learning fundamentals, including supervised and unsupervised learning, model training, classification, and clustering.

Publications

Face Recognition based Attendance System using KNN Algorithm | IEEE Xplore

- Designed and developed a face recognition-based attendance management system using the K-Nearest Neighbors (KNN) algorithm to automate identity verification and attendance recording, reducing reliance on manual attendance processes.
- Applied machine learning-based classification and facial recognition techniques to identify individuals from facial features, exploring automated identification as an approach to streamlining attendance tracking and record management.
- Investigated the practical application of biometric authentication in attendance management, focusing on recognition accuracy, reliable identification, and the potential to improve administrative efficiency through automation.

Graph Neural Networks for Automated Fault Localization in Complex Software Systems | IJMER

- Co-authored research on DepGraph, a Graph Neural Network (GNN)-based approach to automated software fault localization, representing software components and their relationships as graphs to identify potential defects and improve debugging efficiency.
- Explored a dependency-enhanced coverage graph that integrates method-call relationships, test coverage information, and historical code changes to reduce irrelevant connections and improve the identification of faulty code. Evaluated the approach using the Defects4J 2.0.0 benchmark, covering 675 real-world faults across 14 open-source Java projects.
- Investigated the effectiveness and computational efficiency of the proposed approach, with reported improvements over existing methods in fault localization performance. The dependency-enhanced graph reduced GPU memory usage from 143 GB to 80 GB and training time from 9 days to 1.5 days, demonstrating its potential to support more efficient software debugging and maintenance.
